Bank Substitution

Increased Bank Substitution Support
October 3, 2025

SameGoal supports the use of bank values, which allow users to store frequently used text to avoid having to rewrite common content.

For a long time, these bank values have supported name and pronoun substitution, enabling document authors to use the same content for different students because the student's first name and pronouns can automatically substitute into the bank value.

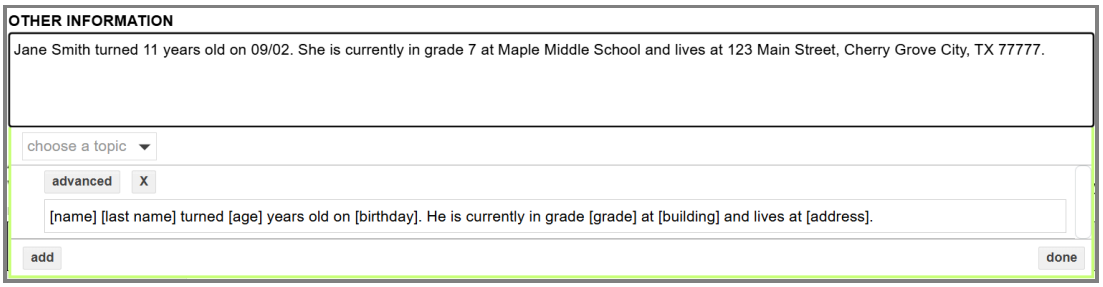

For example, in Jane Smith's document, if you had stored **[name] will tie his shoes** as a bank value, the text will be converted to **Jane will tie her shoes**.

And now, we are very excited to announce that based on user feedback, we have added support for several additional types of bank value substitution:

- [last name]
- [age]
- [birthday]
- [grade]
- [building]

- [address]

These additional options for bank substitution will allow users to create even more powerful bank values and can help save them even more time when authoring documents.

Tip For each type of substitution other than pronouns, the desired element should be written with the square brackets [ ] around it.

Tip For documents with an age field, a default district bank can be created using the [age] substitution so the field is automatically populated with the student's age at the time of creation.
