

Bank Values Updates

Bank Values Updates
November 28, 2023

We've recently made changes to the bank values design in order to limit confusion and make them easier to use.

Changes include:

Minimum bank width: when bank values are added to shorter fields, the bank value display box will extend past the edge of the text field in order to provide a better preview of the saved values.

The screenshot shows a form with a text input field on the left and a display box on the right. The display box is highlighted in green and contains the text "Example stored text. Example stored text. Example stored text. Example stored text." The text field is on the left, and the display box is on the right, extending past the edge of the text field. A red asterisk is visible next to the text field.

Dynamic bank alignment: in the case where the bank value display box is wider than the text field, if the text field is on the left side of the screen, the display box will extend to the right and if the text field is on the right side of the screen, the display box will extend to the left.

Visual indication of longer stored values: in the display box, if a stored value is too long to be displayed fully, an ellipsis will be added to the end to indicate there is more text not being shown. * NOTE: the entirety of the stored value will still be visible while editing the bank values.
